**CAUTION**...DO NOT ATTEMPT TO REMOVE REGULATOR FROM CYLINDER WHILE UNDER PRESSURE! Doing so will destroy the “regulator input” O-ring seal. The regulator grip-ring will be difficult to turn while under pressure, reminding you to bleed the pressure off by closing the main cylinder valve....then remove tubing from regulator.

TO BLEED OFF THE PRESSURE, FOLLOW THESE STEPS:

1. Turn off main cylinder valve (full clockwise). Not much force is needed for full off.
2. Connect at least one MH-3 or MH-4 flowmeter or oxygen feed tube to the outlet port.
3. Let remaining oxygen bleed via one of the connected connectors.

Spare O-Ring
